                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc polypeptide. The encoding DNA is deposited under the accession number cc ATCC No: 209003. The invention provides two human G-protein coupled creceptor polypeptides. The polypeptides are human Estein-Barr Virus CC (EBV)-induced G-protein coupled receptor, designated EBI-2 polypeptide can a human endothelium-differentiation gene (EDG) like G-protein coupled receptor. Vectors CC comprising the EBI-2 and EDG-1-like G-protein coupled receptor. Vectors CC comprising the EBI-2 and EDG-1-like polypeptides encoding DNA can be used to transform host cells for the recombinant production of the proteins. CC Agonists for G-protein coupled receptors can be used for the treatment of CC asthma, parkinson's disease, acute heart failure, hypotension, uninary CC retention and osteoporosis. Antagonists can be used for the treatment of CC hypertension, angina pectoris, myocardial infarction, ulcers, asthma, CC allergies, psychoses, depression, migraine, vomiting, stroke, eating CC disorders, migraine headaches, cancer and benign prostatic hypertrophy.

The present amino acid sequence is the hCHNB, an endogenous human corphan G protein-coupled receptor (GPCR), expressed in left and right cerebellum, kidney and lung. The hCHNB cDNA was identified using full length EST (expressed sequence tag) 764455 as a probe.

The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the identification of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their function in healthy and pathological states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   26-FEB-1999

More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists inverse agonists or partial agonists for use as pharmaceutical agents. AAA46017 to AAA46126 and AAB02825 to AAB02859 represent sequences used the exemplification of the present invention.
                                                                        Human; G-protein-coupled receptor; GPCR; 15625 receptor protein; glial cells; spleen; colon; liver; brain; T-cell; heart; red cell; thymus; B-cell; pancreas; disorder; chromosome 3; anaemia; neutropenia; thrombocytopenia; gene therapy; ss.

                                                                                                                   vectors to be used in gene therapy. The dolynucleotides using the 15625 receptor proteins can also be inserted into vectors to be used in gene therapy. The disorder that may be treated using the 15625 receptor protein polynucleotides and polypeptides include anaemia, neutropenia and thrombocytopenia.
                                                                                                                                                                                               The present sequence shows the 15625 receptor protein. It is a novel G-coupled protein receptor (GPCR). The cDNA for this protein was isolated by screening a human cDNA library with sequences homologous to other GPCRs. The 15625 receptor protein is expressed in the glial cells of the brain. It is also expressed in several other tissues. The 15625 receptor protein may be useful for producing antibodies
                                                                                                                                                                                                                                                                                   Identifying an agent modulating the level or activity of G-protein coupled receptor useful for screening a cell derived from a subject having disorders such as anaemia, neutropenia and thrombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Misc-difference

The invention relates to polynuclootides (AAK51456-AAK53455) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating e.g. stem cell growth factor activity, haematopoiesis regulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tang

The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed CC as p2X12 receptor and its corresponding cDNA molecule. p2X12 receptor is expressed CC as presently principle receptor. The p2X12 receptor is expressed cc selectively in the platelets and brain, and couples to a pertussis toxin-cc selectively in the platelets and brain, and couples to a pertussis toxin-cc sensitive G protein (G1). p2X12 receptor is a G protein-coupled receptor cc sensitive G protein (G1). p2X12 receptor is a G protein-coupled receptor cc infarction, unstable angina, chronic stable angina, transient ischaemic ci infarction, unstable angina, chronic stable angina, transient ischaemic cc infarction, unstable angina, chronic stable angina, transient ischaemic cc thrombosis, embolism, disseminated intravascular coagulation, thrombotic ct thrombosis, embolism, disseminated intravascular coagulation, thrombotic cromplications or a bleeding disorder; thrombotic and cromplications or purpura or a bleeding disorder; vascular graft surgery, cc stent placements or insertion of endovascular devices and prostheses. Cc post CABG (coronary artery bypass graft) surgery, vascular graft surgery or paylic provides targets for screening cc diagnostic applications. P2X12 receptor provides targets for screening cc and other small molecules and combinatorial or naturally occurring compound libraries to regulate platelet aggregation, vascular injury, or compound libraries to regulate platelet aggregation, vascular injury, or and other brain disorders. The present sequence is human p2-purinergic cand other brain disorders. The present sequence is human p2-purinergic crompound paylications paylications paylications paylications paylications paylications paylications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WO200146454-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-DEC-2000;

                                                                                                                                                                                 The 15625 receptor protein is a novel G-coupled protein receptor (GPCR). With sequences homologous to other GPCRs. The 15625 receptor protein is expressed in the glial cells of the brain. It is also expressed in receptor protein is several other tissues. The 15625 receptor protein may be useful for receptor protein. The 15625 receptor protein may be useful for for generating probes, primers and antisense constructs. The polynucleotides encoding the 15625 receptor protein polynucleotides encoding the 15625 receptor proteins can also be inserted into vectors to be used in gene therapy. The disorder that may be treated using the 15625 receptor protein polynucleotides and present sequence is the macaque ortholog of the human 15625 receptor protein polynucleotides.

Example 1; Page 84-85; 108pp; English. Novel isolated ADP receptor, termed P2Y12 receptor polypeptide, a for identifying binding partners and for diagnostic applications useful

The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed CC as P2X12 receptor and its corresponding cDNA molecule. P2X12 receptor is subtype of P2-purinergic receptor. The P2X12 receptor is electively in the platelets and brain, and couples to a pertussis toxin-CC sensitive G protein (Gi). P2X12 receptor is a G protein-coupled receptor is that responds to ADP. The invention also relates to a method for infarction, unstable angina, chronic stable angina; deep venous thrombosis, embolism, disseminated intravasscular coagulation, thrombotic customers by the model of thrombosis, embolism, disseminated intravasscular coagulation, thrombotic restenotic complications following angioplasty, carotid endarterectomy, post CABG (coronary artery bypass graft) surgery, vascular graft surgery,

P2Y12 receptor is useful for identifying binding partners and for idagnostic applications. P2Y12 receptor provides targets for screening synthetic small molecules and combinatorial or naturally occurring compound libraries to regulate platelet aggregation, vascular injury, or disease as well as schizophrenia, eating disorders, depression, migraine and other brain disorders. The present sequence is a fragment of human P2-purinergic receptor subtype, referred as P2Y12.
                                                                                                                                                                                                                   Rat; P2-purinergic receptor; P2Y12; cardiant; vasotropic; thrombolytic; cerebroprotective; gynaecological; ADP; adenosine 5' diphosphate; angina; myocardial infarction; ischaemic attack; preeclampsia; bleeding disorder; carotid endarterectomy; vascular graft surgery; brain disorder; migraine; vascular injury; schizophrenia; eating disorder; depression; angioplasty; peripheral vascular disease; platelet aggregation; restenotic; embolism; thrombocytopaenic purpura; stroke; pertussis toxin-sensitive G protein; c1; disseminated intravascular coagulation; thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                      Rat P2-purinergic receptor subtype, P2Y12.
                                                                                                                                                                                                                                                                                                                                                                                                                             04-SEP-2001

```
The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed composed as P2Y12 receptor and its corresponding cDNA molecule. P2Y12 receptor is corresponding cDNA molecule. P2Y12 receptor is expressed consistively in the platelets and brain, and couples to a pertussis toxing sensitive grotein (Gi). P2Y12 receptor is a grotein-coupled receptor conference which is useful for modulating acute myocardial confertifying an agent which is useful for modulating acute myocardial conference which is useful for modulating acute myocardial conference who is a chronic stable angina, transient ischaemic conference who is a chronic stable angina, transient ischaemic conference who is a chronic stable angina, transient ischaemic conference who is thrombosis, peripheral vascular disease, preeclampsia, deep venous conference complications following angioplasty, carotid endarterectomy, constituted complications following angioplasty, carotid endarterectomy, constituted articles and conference and prostheses. The present graft surgery, vascular graft surgery, stent placements or insertion of endovacular devices and prostheses. Compound libraries to regulate platelet aggregation, vascular injury, or compound libraries to regulate platelet aggregation, vascular injury, or and other brain disorders. The present sequence is rat P2-purinergic conference as the prosteried as P2Y12 receptor.
                                                                                                                                                                                                                                          В
                                                                                                                                                                                                                                                                     Qy
                                                                                                                                                                                                                                                                                                     В

The DNA encoding this protein was identified from a rat brain stem/spinal cord cDNA library. In situ hybridisation analysis showed that MP-10 receptor mRNA is expressed diffusely but ubiquitously in the adult rat central mervous system (CNS). The mRNA was also found in adult rat spleen. MP-10 receptor protein contains several structural features characteristic of a G protein coupled receptor (GPCR). MP-10 receptor protein is useful for identifying new anaesthetic and analgesic agents. Such agents may be identified using assays designed to detect agonists or antagonists capable of binding to the receptor, in therefore modulating intracellular signalling.

The invention relates to ADP (adenosine 5'-diphosphate) receptor, termed CC as P2712 receptor and its corresponding CDNA molecule. P2712 receptor is captered to the subtype of P2-purinergic receptor. The P2712 receptor is expressed CC selectively in the platelets and brain, and couples to a pertussis toxin CC sensitive G protein (Gi). P2712 receptor is a G protein-coupled receptor CC that responds to ADP. The invention also relates to a pertussis toxin CC identifying an agent which is useful for modulating acute myocardial CC infarction, unstable angina, chronic stable angina, transient ischaemic CC thrombosis, embolism, disseminated intravascular coagulation, thrombotic cthrombosis, embolism, disseminated intravascular coagulation, thrombotic CC thromboytopaenic purpura or a bleeding disorder; thrombotic and CC restenotic complications following angioplasty, carotid endarterectomy, CC post CABG (coronary artery bypass graft) surgery, vascular graft surgery, CC stent placements or insertion of endovascular devices and prostheses. CC P2712 receptor is useful for identifying binding partners and for CC disease as well as schizophrenia, eating disorders, depression, migraine CC compound libraries to regulate platelet aggregation, vascular injury, or Cdisease as well as schizophrenia, eating disorders, depression, migraine CC receptor subtype, P2712 truncated allelic variant. The variant is CC obtained by deleting two bases 'CA' from position 789-790 of the wildtype human P2712 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 29; Page 91-92;

          Sequences AAB23029-B23048 represent human SECX proteins. The SEQX proteins of the invention are either secreted or membrane-associated proteins and act as regulator of ceillular proliferation and differentiation. SECX proteins or nucleotides are useful for diagnos,
                                                                                                             Novel human membrane associated or secreted polypeptides and polynucleotides useful for diagnosis, prevention and treatment pathological states such as cancer, immune, cardiovascular and neurological disorders
                                                                                                                                                                                                                                                                                  09-MAR-1999; 99US-0123667

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC levels of SECX proteins and nucleotides. The SECX proteins are also CC useful to screen compounds that modulate SECX activity or expression. The CC interaction of a SECX protein with other cellular proteins may be useful CC to modulate the activity of a partner protein, cellular proliferation, CC cellular differentiation and cell survival. SECX nucleotides are useful CC for the recombinant expression of SECX protein, and may be used detect CC SECX mRNA or genetic lesions in the SECX protein, and may be used to CC modulate SECX expression (e.g., using antisense oligonucleotides). SECX CC nucleic acid sequences are also useful for identifying a cell or tissue CC type in a biological sample, and in forensic biology. SECX primers or CC probes are useful for detecting the presence of SECX nucleotides and for SCC screening tissue cultures for contamination. Diseases that may be treated CC or prevented using SECX proteins or nucleotides include cancer (e.g., CC colorectal carcinoma, prostate cancer), benigh tumours, immune discorders (including autoimmune diseases, transplant rejection, allergies, AIDS), confections, inflammatory disorders, carthritis, haematopoietic disorders, cardiovascular disorders, arthritis, haematopoietic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches 155;

The invention be used for screening of agents expected to be useful for prevention and treatment of central nervous system (CNS) diseases. The present sequence the G protein coupling receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAE02494 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein and coding sequences for a novel human G protein coupled receptor. This is useful in the identification of treatments for central nervous system diseases such schizophrenia, Parkinson's disease and aches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 1; Page 11; 14pp; Japanese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (YAMA ) YAMANOUCHI PHARM

                 their corresponding DNA molecules. GPCR is also referred as seven transmembrane receptor. G protein coupled receptor protein is useful for treating neurological disorder, particularly schizophrenia. GPCR protein is also useful for identifying compounds useful for treating other schizophrenia. These compounds are also useful for treating other neurological and psychiatric diseases, e.g. depression, anxiety, bipolar disease, affective disorders, attention deficit hyperactivity disorder/ attention deficit disorder, epilepsy, neuritis, neurostathenia, neuropathy, neurostas, Alzheimer's disease, Parkinson's disease, migraine and senile dementia. The invention also provides genetic screening procedures that entail analysing a person's genome with respect to GPCR. The vectors are useful for the recombinant production of the GPCR's. The present sequence is human GNNATA correction.
                                                                                                                                                                                                                                         Seven transmembrane receptor polypeptides and polynucleotides, useful for treating neurological or psychiatric disorders, e.g. schizophrenia as well as for identifying compounds useful for treating schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              03-MAY-2001.
